

### Industry Pressure Regulator

The Ningdian® industry pressure regulator refers to a device that decompresses the high-pressure gas stored in the cylinder to the low-pressure required for gas welding work. Due to the high pressure in the gas cylinder, the pressure required for gas welding and gas cutting and the point of use is relatively small, so it is necessary to use a pressure regulator to reduce the higher pressure gas stored in the gas cylinder to a low pressure gas, and it should be ensured that The

required working pressure remains constant throughout. In short, the China Ningdian® pressure regulator is a regulating device that reduces high-pressure gas to low-pressure gas and keeps the pressure and flow of the output gas stable.

### Product Description

According to different working principles, the **industry pressure regulators** made in China can be divided into two types: positive-action type and reverse-action type. Common domestic pressure regulators are mainly of two types: single-stage reaction type and two-stage hybrid type (the first stage is a positive-action type, and the second stage is a reverse-action type).

According to the medium, the Ningdian® pressure regulators can be divided into oxygen pressure regulator, Industrial regulator, Medical Regulator ETC and so on.
