

vertical coil packing machine

The Yilane Tech® vertical coil packing machine is mainly designed for metallurgical industries and widely used for wrapping steel coil, copper coil, aluminum coil, wire coil and other coiled objects.

The Yilane Tech® vertical coil packing machine is specially used for wrapping wires, hoses, corrugated pipes and other products. The advantage of vertical coil packing machine is that it completely replaces the manual winding packaging, the packaging speed is fast, the operation is convenient, the production efficiency is greatly improved, and the labor intensity of workers is reduced.

Yilane Tech® vertical coil packing machine Basic features:

The horizontal structure of Yilane Tech® vertical coil packing machine is adopted, and the products are packaged by hoisting, conveying or manual means

Internal or external structure can be adopted as required

Adopt PLC programmable controller and HMI touch screen

Automatic alarm, automatic display of fault content

Slip ring automatic positioning

Taper roll drive and external guard roll protection

Lighter products are equipped with upper pressure rollers

The overlap and tightness of the packing belt can be adjusted as required

The slip ring can move back and forth to adapt to products with different inner and outer diameters

High abrasion resistant polyurethane friction wheel is adopted, and the slip ring is of integral casting structure

Optional synchronous winding mechanism, which can simultaneously complete synchronous winding of two different packaging materials

Both idler and guard roll are coated with polyurethane
